Application No. 09/9/6,723 Docket No. 741/90-19

## AMENDMENTS TO THE CLAIMS

The following set of claims is presented in accordance with 37 C.F.R. 1/121 and by making this submission any claim not indicated as currently amended is asserted not to be changed relative to the immediate prior version of the claim.

1. (Previously Presented) A surgical device (1) for use in minimally invasive surgery of the type using an inflated body cavity (2) accessible to a surgeon through an access port, defined by the device (1), surrounding an incision in a patient's body, the device having:

distal body cavity engagement means (5) for insertion into the incid on to locate the device in position;

proximal fixing means (6) for attaching the device to a patient's ski i;

a sleeve (4) connected between the body cavity engagement meant (5) and the fixing means defining an access port; and

characterized in that the device includes sealing means (10, 12), operating on the sleeve (4) to prevent substantial leakage of gas from the body divity (2) on inflation when in an inoperative position and formed to mould to a substantial portion of a surgeon's hand or surgical instrument on insertion in an operating position, the sealing means being provided by an inflatable first seal (10) for sugaging and retracting the incision and a second inflatable seal (12) for sealing the lumen of the tube or sleeve bore.

- 2. (Cancelled)
- 3. (Currently Amended) A surgical device (1) as claimed in Claim 1 or Claim 92, in which the body cavity engagement (5) means is provided by a distal ring (5) formed for insertion into the incision.
- 4. (Previously Presented) A surgical device as claimed in Claim 1, in which the fixing means is provided by a proximal ring for engaging with a patient's skin.

- (Previously Presented) A surgical device (1) as claimed in Claim 4, in 5. which the proximal ring (6) has an associated connector ring for receivirg additional seals or medical instruments.
- (Previously Presented) A surgical device as claimed in (laim 1, in which the first seal (10) is provided by an inflatable bladder (10) extending outwardly from the sleeve on inflation to form a seal with the incision.
- (Previously Presented) A surgical device as cited in any one of the 7. preceding claims, in which the second seal (12) is provided by an inflathble bladder (12) extending inwardly from the tube or sleeve (4) on inflation to prevent excessive loss of gas through the access port.
- (Previously Presented) A surgical device as claimed in Claim 7, in 8. which the second seal (12) is operatively connected and mounted within he first seal (10).
- (Previously Presented) A surgical device (1) for use it minimally 9. invasive surgery of the type using an inflated body cavity (2) accessible to a surgeon through an access port, defined by the device (1), surrounding an incision in a patient's body, the device having: -

distal body cavity engagement means (5) for insertion into the incition to locate the device in position;

proximal fixing means (6) for attaching the device to a patient's skin;

a sleeve (4) connected between the body cavity engagement mean(s (5) and the fixing means defining an access port; and

characterized in that the device includes sealing means (10, 12), operating on the sleeve (4) to prevent substantial leakage of gas from the body (avity (2) on inflation when in an inoperative position and formed to mould to a substantial portion of a surgeon's hand or surgical instrument on insertion in an operating position, the sealing means being provided by an inflatable first seal (10) for logaging and -4- Application No. 09/416,723 Docket No. 7411:90-19

retracting the incision and a second inflatable seal (12) for sealing the 14 men of the tube or sleeve bore,

in which the sleeve (4) is provided by a perforated wall defining a (ubstantially cylindrical tube.
